

Math 1100 Final

Name: _____

Created: Fri Apr 07 12:02:58 MDT 2006

Directions: Work all problems included. If you need more room use the back of the page to complete the problem. You may use a calculator for computing numerical values. However, you may not use calculators for symbolic calculations unless the problem indicates this can be done. For full credit you must show all work including algebraic steps.

Problem 1: Is the following function continuous on the interval $[-1, 0]$.

$$f(x) = \frac{x+2}{x}$$

Explain your answer. If necessary, use one-sided limits at the endpoints to justify your answer.

Problem 2: Suppose that you know the following limits at $x = 4$

$$\lim_{x \rightarrow 4} f(x) = 2, \quad \lim_{x \rightarrow 4} g(x) = \frac{3}{2}, \quad \text{and} \quad \lim_{x \rightarrow 4} h(x) = -1,$$

compute the following limits.

$$\lim_{x \rightarrow 4} [h(x) - 3f(x)] =$$

$$\lim_{x \rightarrow 4} (-2 - h(x)) =$$

$$\lim_{x \rightarrow 4} 2h(x)g(x) =$$

Problem 3: Decide whether the variables in the differential equation can be separated.

$$x \frac{dy}{dx} = \frac{x^2}{y^2}$$

Problem 4: Compute the following antiderivative.

$$\int 7x^{-2} dx$$

Problem 5: Compute the derivative of the following function using the quotient rule.

$$f(x) = \frac{x - 2}{7 - x}$$

Problem 6: Find the absolute extrema of the function on the closed interval

$$f(x) = 5 - 2x^2 \quad [0, 3]$$

Problem 7: Use integration by parts to compute the following definite integral.

$$\int_0^1 t \ln(2t + 1) dt$$

Problem 8: Find the second partial derivatives of

$$z = x^2y^3 - 2xy + 3y^2 - x^2 - 40$$

That is, compute

$$\frac{\partial^2 z}{\partial x^2}, \quad \frac{\partial^2 z}{\partial x \partial y}, \quad \frac{\partial^2 z}{\partial y \partial x}, \quad \frac{\partial^2 z}{\partial y^2}$$

Problem 9: Suppose we want to analyze the function $f(x) = 3x^4 - 8x^3 + 6x^2$. **a.** Determine all points where the concavity of the function is zero. **b.** Which of these points are inflection points.?

Problem 10: Find the equation of a tangent line to the function at the indicated point.

$$g(x) = 2 + e^{3x^2} \quad (0, 3)$$
